FreeHand 8

Unnamed colors separate incorrectly

Problem: Freehand files color separate as 4-color process. You want a two-color spot separation and can't find the colors to change them.

This problem probably resulted from mixing the colors and not naming them **or** deleting the colors from the **Color List**. Removing colors from the **Color List** does not remove them from corresponding FreeHand objects.
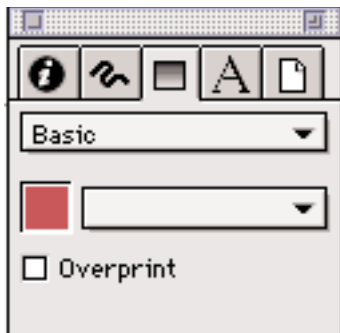

≺ Unnamed colors display like this in the **Inspector** window. The color shows but no color name.

When the object is selected no color name is highlighted in the **Color List.** ➢
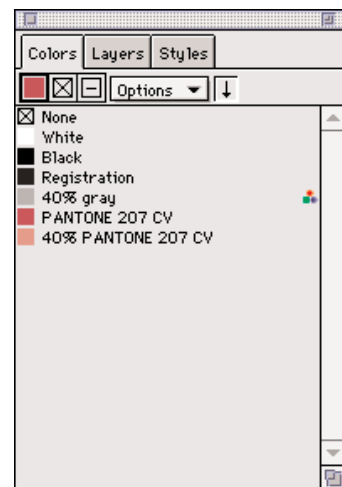

To correct the problem choose the **XTRAS** tab at the top of the screen. Pull down to **COLORS > NAME ALL COLORS**. This will add all the names of the unnamed colors to the **Color List**.

Now go to **Options** on the **Color List** window ➢.
Select **Replace** and change the incorrect colors to the colors you actually want in your separations.

Test your separations by printing your job color separated to your laser printer.

Read more about managing colors in FreeHand 8 on pages 152-161 of the manual.
